

## New Research Reveals How Cranberry Products Prevent Urinary Tract Infections

**Date:** 10 Mar 2009

**Summary:** *Urinary tract infections (UTIs) burden the healthcare system with more than \$2 billion in treatment costs each year and a urinary catheter in place.*

10/03/09 Chemicals present in cranberries—and not the acidity of cranberry juice, as previously thought—prevent infection-causing bacteria from adhering to the urinary tract, as documented in a report published in *Journal of Medicinal Food*, a peer-reviewed journal published by Mary Ann Liebert. The article is available free online at [www.liebertpub.com/jmf](http://www.liebertpub.com/jmf)

Urinary tract infections (UTIs) burden the healthcare system with more than \$2 billion in treatment costs each year and are a common cause of hospitalization. Adhesion of *E. coli* bacteria to cells lining the urinary tract is the first step in the development of a UTI. Chemicals called proanthocyanidins (PACs) prevent *E. coli*, which is the cause of about 85% of UTIs and 90% of cases of acute pyelonephritis, from adhering to cells by affecting the surface properties of the bacteria.

Paola Pinzón-Arango, Yatao Liu, and Terri Camesano, from Worcester Polytechnic Institute, in Massachusetts, exposed *E. coli* to a cocktail of cranberry PACs and measured the adhesion forces between the bacteria and a silicon surface using atomic force microscopy. The bacteria were exposed to either the cranberry juice or the PACs and the greater the decrease in bacterial attachment. In the article "Adhesion Forces and Implications for *Escherichia coli*—Uroepithelial Cell Attachment," the authors also concluded that this effect was reversible: an environment without cranberry juice or PACs regained the ability to attach to the model surface.

"Cranberries, one of only three species of fruits native to North America, has a long history of medicinal food use. Native Americans used cranberries to treat urinary and kidney ailments hundreds of years ago. The article by Camesano and co-workers is a milestone in the understanding of its mechanism of action." —Dr. Robert M. Hendler, PhD, MD, Co-Editor-in-Chief of the *Journal*, and Clinical Professor of Medicine, University of California, San Diego.
